Five imported cases of COVID-19, four from the Philippines and one from Hong Kong, were reported yesterday, bringing the total confirmed cases in Taiwan to 467, the Central Epidemic Command Center (CECC) said yesterday.

The four returning from the Philippines were on the same flight, and the local health department has identified 15 people who had direct contact with them — including 10 passengers in the two rows in front or behind them, who have been put under 14-day home isolation, and five crew members, who will practice 14-day self-health management, said Centers for Disease Control (CDC) Deputy Director-General Chuang Jen-hsiang (莊人祥), the CECC spokesperson.

The same applies to the 12 passengers who sat in the two rows in front or behind the person returning from Hong Kong and crew members on that flight, he said.

As for the case of a Thai migrant worker in Bangkok who tested positive for COVID-19 after returning from Taiwan on Tuesday last week, Chuang said that 29 close contacts have been identified, including 18 who lived in the same dormitory — who have been placed in mandatory isolation — and 11 colleagues, who have been asked to practice self-health management.

The man, in his 30s, developed diarrhea on Wednesday, but did not develop a fever or other symptoms, but tested positive on Saturday in a reverse transcription polymerase chain reaction (RT-PCR) test, Chuang said.

Of the 18 dorm mates, one person developed a cough and runny nose on Saturday and is being isolated at a hospital, while the others have been placed in a centralized quarantine facility, he said.

RT-PCR results for 28 were negative and one is still being tested, while nucleic acid-based testing for antibodies also was negative in 28 people, while one is still being tested, Chuang said.

An additional 160 people who work at the same company have also been given RT-PCR tests and none have displayed symptoms, and the CECC is checking National Health Insurance data to identify any migrant workers in the Taoyuan area who might have recently sought treatment for suspected COVID-19 symptoms, he said.

As for the new imported cases, No. 463 is a man in his 50s who traveled to the Philippines in March for work, the spokesman said.

He developed a fever, a cough, impaired sense of smell, diarrhea and weakness on Tuesday last week, and sought treatment and was tested for COVID-19 on Friday, but he did not receive the test result before he returned to Taiwan on Sunday, Chuang said.

The man had a slight fever upon arrival at Taiwan Taoyuan International Airport, so he was tested for COVID-19 at the airport and taken to a centralized quarantine facility, the spokesman said.

Case No. 464 is man in his 30s, who has been working in Hong Kong since January, who began suffering chills and night sweats on July 16, but did not seek medical attention until he developed nasal congestion and an abnormal sense of smell on Thursday, he said.

Case No. 465 is a man in his 30s who had worked in the Philippines since January, and developed a cough, abnormal sense of smell, a sore throat and muscle pain on June 19, but tested negative for COVID-19 when he sought treatment, so he took over-the-counter cold medicine, Chuang said.

Both men reported their symptoms to airport officials and received their positive test results

yesterday, he said.

Cases 466 and 467 are a married couple in their 70s who traveled to the Philippines in January to visit family, he said.

The woman (No. 467) developed a fever, a cough and shortness of breath on July 17, but took medicine on her own and did not seek treatment, he said.

However, she reported her symptoms before boarding Sunday's flight and upon arrival, so she and her husband were tested at the airport, he added.
